Preface

Midway through the year, the Cambridge University-Nanjing Centre of Technology and Innovation (hereinafter the "Centre") remains committed to original research, coordinating its effort across technology development, industrial empowerment, international activities, and ecosystem development, to steadily consolidate the foundations for its development.

In the first half of the year, the Centre successfully signed and launched Phase II projects, met key milestones for ongoing research projects on schedule, steadily expanded its intellectual-property output, accelerated the commercialisation and practical application of research outcomes, and continued to deepen its industry-academia-research collaboration network. Leveraging Cambridge's global science and innovation resources, the Centre continued to build high-level international exchange platforms and successfully hosted flagship events including "Cambridge Nanjing Forum 2026-Pathogenesis and Clinical Treatment of Parkinson's Disease" and "Applying to Cambridge: Undergraduate Study at Cambridge 2027". International talent-training programmes were also launched in an orderly manner. The Centre continued to broaden domestic and international cooperation channels, actively integrate into global innovation networks, and promote the deep integration of high-quality international science and innovation resources with local industrial development.

Looking back over the first half of the year, the Centre is moving forward with renewed momentum. Upholding an open and inclusive cooperation framework and an enterprising research spirit, the Centre has clarified its development pathway through review and consolidation. It will continue to focus on frontier themes, deepen work in key areas, strengthen international cooperation, enhance the output of research outcomes, and pursue a sustainable development path.

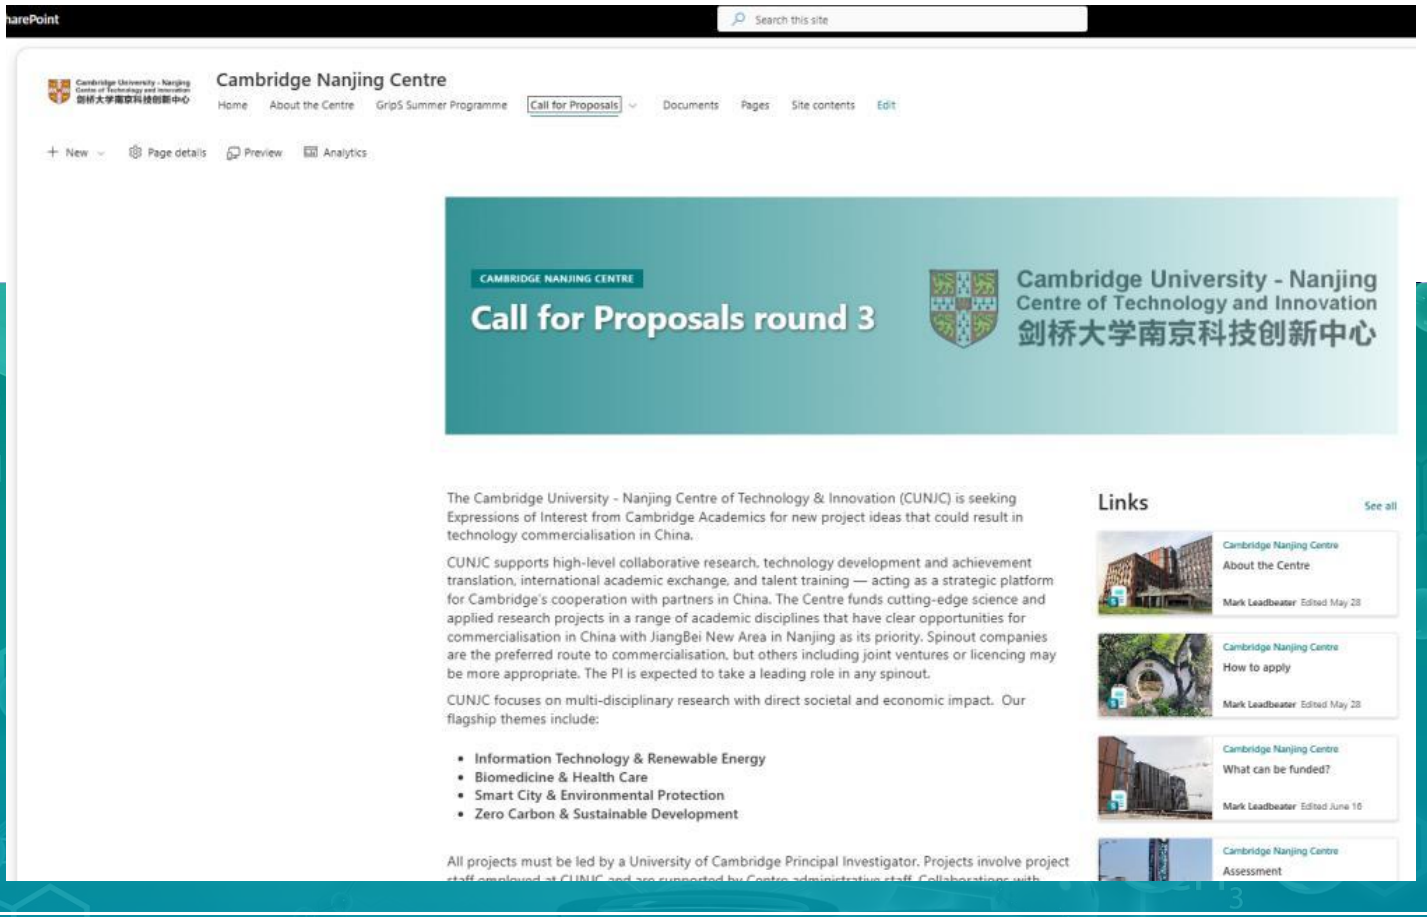

01 Consolidate Research Foundations

The Centre continued to optimise its research layout, promoting the full launch of the first batch of Phase II projects and the orderly collection of intentions for the second batch. Ongoing projects achieved key milestones as scheduled, produced high-level academic outcomes, steadily advanced domestic and international-patent deployment, expanded research teams, and further consolidated the development foundation for technological innovation and research commercialisation.

Growth of the Project Pipeline

The University of Cambridge has been deeply involved in the Centre's research project approval process, advancing project implementation and pipeline development in two batches each year. In the first half of the year, the first batch of Phase II research projects completed signing and formally commenced R&D work. Each project has advanced core tasks as scheduled, including research-team formation, supporting facilities, and scientific research; while preparation of semi-annual progress reports has proceeded in an orderly manner. Collection of the second batch of Phase II projects has now been completed. The Cambridge Nanjing project team widely solicited project intentions across University departments and research networks, and submitted 16 project intentions through the Centre. These are now being matched with local industrial directions in line with the industrial layout of Jiangbei New Area, further enriching the project pipeline and laying a solid early-stage foundation for subsequent project approval and implementation.

Consolidate Research Foundations

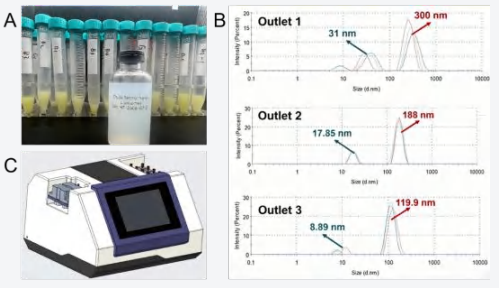

Progress of Ongoing Projects

• Obesity: Pathogenesis, Diagnostic Biomarkers, and Therapeutic Targets-The Metabolically Healthy Obesity (MHO) Paradox in China

The project team has achieved staged progress in work related to mouse-model construction and phenotypic analysis. It has verified that the relevant targets can be applied to the development of drugs for the prevention and treatment of metabolic dysfunction-associated steatotic liver disease. The team is currently engaging with leading pharmaceutical companies and carrying out related validation and testing, steadily advancing the commercial implementation of research outcomes.

• DropBioApp Engineering Droplet-based Microfluidic Platform

• **Nano-formulation preparation platform:** the project has completed preliminary screening of the microfluidic-preparation process for the liposome-retinol system and identified a basic formulation that can be prepared stably without precipitation, namely a quaternary HSPC/cholesterol/retinol/alpha-tocopherol system. Small-scale testing achieved a particle size of 115.4 nm, indicating that the formulation has preliminarily met the basic conditions for industrialisation. Going forward, the team will continue to advance downstream purification, lyophilisation-process development, and cell-safety evaluation around this formulation, gradually improving the full-process technology chain.

• **Microfluidic exosome-separation platform:** the overall design of the automated separation equipment has been completed and the drawings finalised, meaning that the project is ready to proceed to engineering manufacture. Equipment assembly, commissioning, and performance validation will follow.

• **Industry-academia-research collaboration:** the project team has established research and industrial links with biopharmaceutical and healthcare enterprises in Jiangbei New Area, and is exploring cooperation opportunities for joint technology development around platform engineering and biological applications. At the same time, it has built a multi-level cooperation system with Fudan University and the Nanjing University Institute of AI and Biomedicine, covering joint scientific research, in-depth academic exchange, and coordinated commercialisation.

Consolidate Research Foundations

• Multi-modality and Hybrid 3-D Ultrasound/Photoacoustic Imaging System

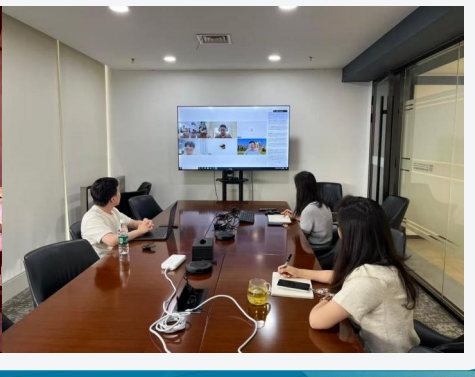

The project has maintained long-term, in-depth cooperation with Nanjing University and Nanjing Brain Hospital. Based on practical clinical-application scenarios for photoacoustic microscopy, the team has carried out secondary development of equipment functions and advanced biological-sample collection and testing, multi-group imaging-comparison experiments, and validation of imaging-scheme effectiveness in an orderly manner. At the current stage, it has begun developing a market-oriented prototype and preparing for early-stage commercialisation.

• Development of Diagnostic Method of Parkinson's Disease Based on AI-Assisted Gait Pattern Analysis

The project is progressing smoothly. The Centre has reached a cooperation agreement with Nanjing Brain Hospital, and the R&D team has been preliminarily established. At present, the multi-view gait-data acquisition platform has been built and has completed preliminary commissioning. The server-side visual-algorithm operating environment has also been established, enabling stable real-time acquisition and efficient decoding of six video streams. In terms of model development, training of traditional machine-learning models based on multi-source data has been completed, while construction and optimisation of deep-learning models such as LSTM and Transformer are being advanced in parallel. The overall R&D system is steadily being upgraded towards intelligent and multi-modal integration.

Consolidate Research Foundations

• Increasing Battery Lifetime through Advanced Electrode Stack-pressure Control

Initial staffing for the project is in place. The team is coordinating work around core-technology development and engineering implementation; laboratory-condition renovation has been fully launched, and the staged safety assessment has been largely completed.

▶ Project PI Professor Michael De Volder at the Centre

• HVDC 800-50V DC-DC Power Supplies for Data Centres

The project is carrying out industrial collaboration with Nanjing EPIC Power Technology Co., Ltd. to jointly advance technology R&D and engineering implementation for the High-Voltage Direct-Current (HVDC) DC-DC power supply system. The overall R&D pathway is clear, with technology development and commercialisation engagement proceeding in parallel, continuously strengthening the key technical foundation for efficient data centre power-supply systems.

▶ Image source: EPIC Technology

• Global Transparent Environmental Reporting: Enabling Chinese Manufacturers to Embrace Green Trade Opportunities (GTERCN)

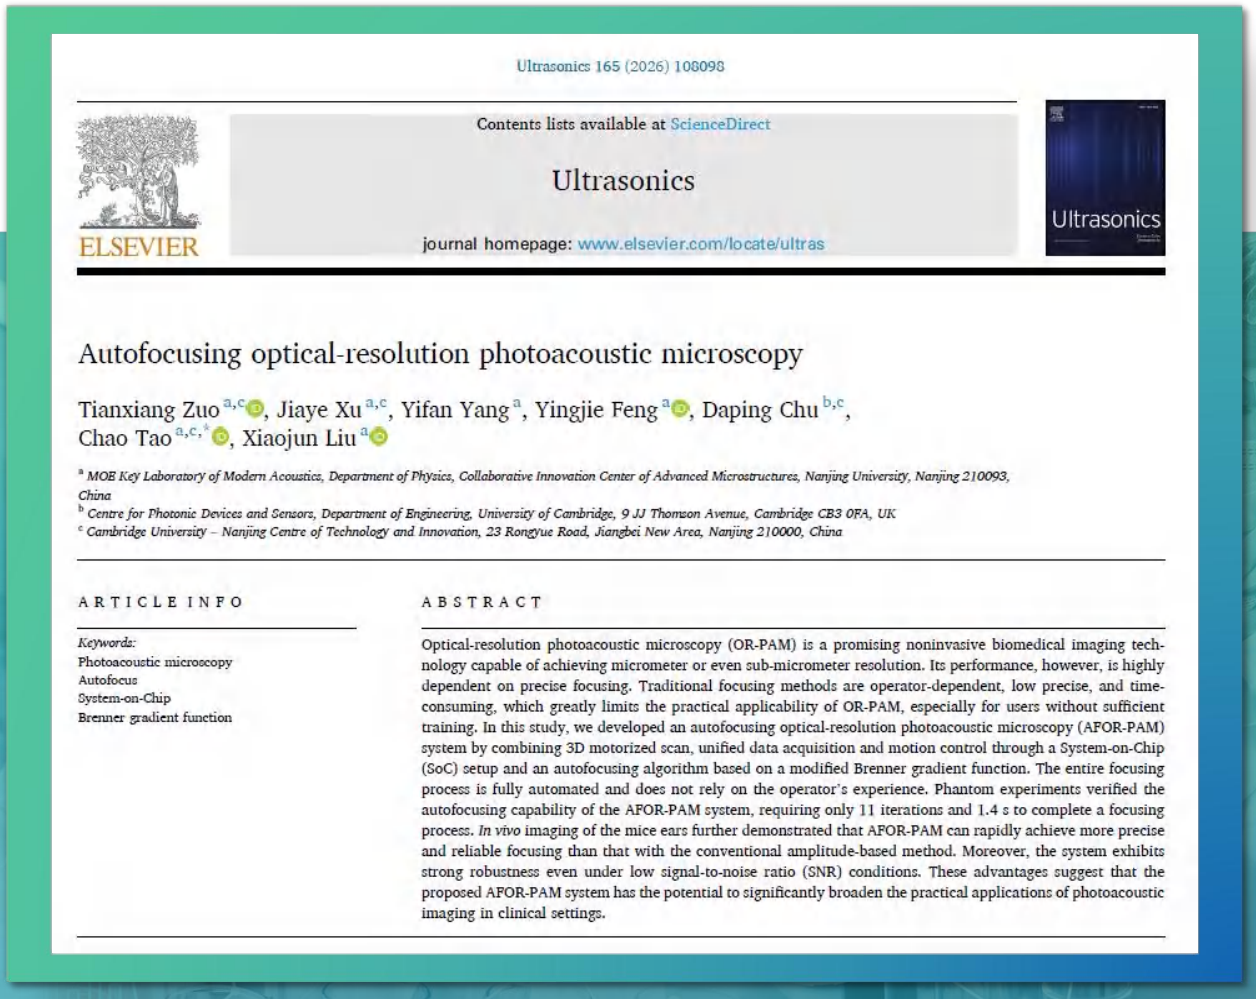

The project has progressed steadily in response to the needs of overcoming green trade barriers and enhancing corporate-carbon competitiveness. It has laid a sound foundation for carbon-data traceability, quantification, and intelligent analysis, and continues to strengthen enterprises' competitive advantages within the global green-trade system.

▶ Project PI Professor Jia Lili

Scientific Research Outputs

• Academic Publications

The project team of the "Multi-modality and Hybrid 3-D Ultrasound/Photoacoustic Imaging System" published one paper in Ultrasonics, entitled "Autofocusing optical-resolution photoacoustic microscopy". The paper proposes an autofocusing photoacoustic microscopy imaging system integrating a system-on-chip with an improved Brenner-gradient focusing algorithm, removing reliance on manual focusing. Phantom and in vivo mouse-imaging experiments demonstrate fast and precise focusing, better image quality than the conventional amplitude-feedback method, and stable, reliable performance even under low signal-to-noise-ratio conditions, supporting the move of photoacoustic imaging towards clinical application.

Brenner gradient function

ABSTRACT

Optical-resolution photoacoustic microscopy (OR-PAM) is a promising noninvasive biomedical imaging technology capable of achieving micrometer or even sub-micrometer resolution. Its performance, however, is highly dependent on precise focusing. Traditional focusing methods are operator-dependent, low precise, and time-consuming, which greatly limits the practical applicability of OR-PAM, especially for users without sufficient training. In this study, we developed an autofocusing optical-resolution photoacoustic microscopy (AFOR-PAM) system by combining 3D motorized scan, unified data acquisition and motion control through a System-on-Chip (SoC) setup and an autofocusing algorithm based on a modified Brenner gradient function. The entire focusing process is fully automated and does not rely on the operator's experience. Phantom experiments verified the autofocusing capability of the AFOR-PAM system, requiring only 11 iterations and 1.4 s to complete a focusing process. *In vivo* imaging of the mice ears further demonstrated that AFOR-PAM can rapidly achieve more precise and reliable focusing than that with the conventional amplitude-based method. Moreover, the system exhibits strong robustness even under low signal-to-noise ratio (SNR) conditions. These advantages suggest that the proposed AFOR-PAM system has the potential to significantly broaden the practical applications of photoacoustic imaging in clinical settings.

Biomedicine & Pharmacotherapy

Apremilast attenuates hepatic steatosis and metabolic dysfunction in a murine model of MASLD: Implications for patients with Psoriatic disease

The project team of "Obesity: Pathogenesis, Diagnostic Biomarkers ,and Therapeutic Targets-The Metabolically Healthy Obesity (MHO)Paradox in China" published four papers in Biomedicine &Pharmacotherapy, Life Metabolism, Proceedings of the National Academy of Science, and Cell Research.

The paper "Apremilast attenuates hepatic steatosis and metabolic dysfunction in amurine model of MASLD" demonstrates that apremilast can reduce obesity-induced, hepatic-lipid accumulation and systemic-metabolic dysfunction, alleviate fatty liver and insulin resistance, and provide an intervention target for obesity complicated by metabolic liver disease.

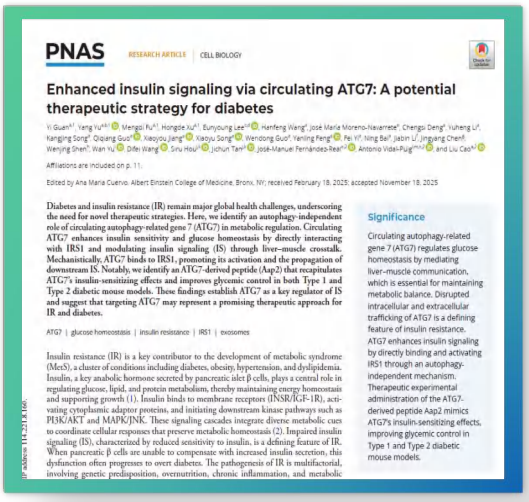

Life Metabolism

Glycine–GLRA1–calmodulin signaling regulates endoplasmic reticulum calcium to sustain insulin secretion and β-cell function

The paper "Glycine-GLRA1-calmodulin signaling regulates endoplasmic reticulum calcium to sustain insulin secretion and B-cell functio" analyses the mechanism by which the glycine-GLRA1-calmodulin pathway regulates pancreatic-islet function. It can improve obesity-associated hyperglycaemia and provide new dietary and pharmaceutical directions for obesity-related diabetes.

PNAS RESEARCH ARTICLE | CELL BIOLOGY

Enhanced insulin signaling via circulating ATG7: A potential therapeutic strategy for diabetes

Significance

The paper "Enhanced insulin signaling via circulating ATG7: A potential therapeutic strategy for diabetes" clarifies how circulating ATG7 enhances insulin signalling by regulating liver-muscle crosstalk, and designs bioactive peptides to improve obesity-induced insulin resistance, opening a new therapeutic pathway for obesity-related glucose and lipid complications.

The paper "Lactate-activated GPR81/FARP1 signaling drives insulin-independent glucose uptake and metabolic control" reveals that activation of the GPR81 pathway by lactate enables insulin-independent glucose lowering, improves glucose utilisation in people with obesity, and provides an independent glucose-lowering strategy for people with obesity and insulin resistance.

• Chinese Patent Applications

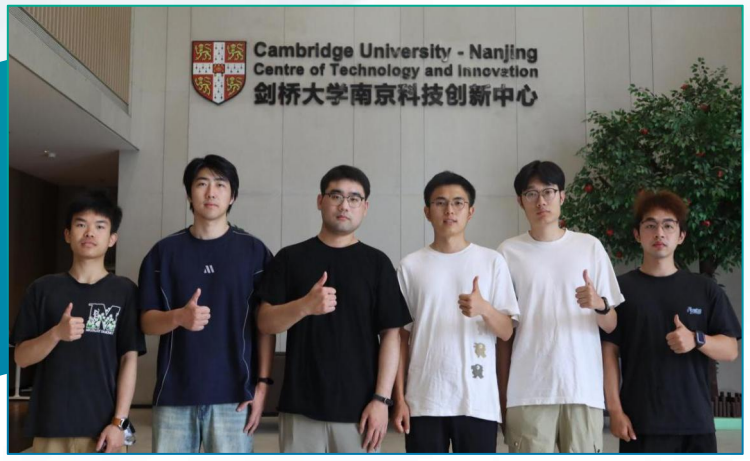

In the first half of 2026, one new Chinese patent application was added. To date, the Centre has obtained a cumulative total of eight granted invention patents in China, with seven further invention patents under application. Overseas patent deployment is also being actively advanced; one PCT international patent and one United States patent have entered the examination process, contributing to a multi-level domestic and international patent-protection system.

Formation of Scientific Research Project Teams

The Centre has steadily advanced the formation of scientific research project teams and talent pipelines, carried out recruitment for ongoing projects, and continued to strengthen its core R&D capacity, thereby supporting the smooth implementation of research projects.

• Project Team for "Development of Diagnostic Method for Parkinson's Disease Based on AI-Assisted Gait Pattern Analysis"

In April 2026, Associate Professor Han Bin of Nanjing University of Posts and Telecommunications, and Master's Supervisor at Southeast University Sun Hao, joined the Centre's Gait Analysis Project team. They focus on behavioural-signal feature mining and AI-model R&D, providing technical support for the implementation and application of a multi-modal AI-assisted diagnosis and monitoring system. In response to integrated needs including system-model computation, optimisation control, and visual-interface development, the team is building software and hardware programmes and interfaces, establishing an operating system, and supporting the project's clinical-application requirements.

In the same month, interns Huang Xin and Chen Fusen from Nanjing University of Posts and Telecommunications, together with interns Wang Zihao, Xia Ming, Yu Hang, and Lu Xijun from Southeast University, successively joined the project team. They are assisting with the construction of a standard dataset for gait annotation, hardware set-up for the gait-acquisition system, and the development and optimisation of gait-analysis algorithms.

• Project Team for "DropBioApp Engineering Droplet-based Microfluidic Platform for Biological Applications"

In March 2026, full-time researcher Xuan Dechun joined the project team and participated in process development and commercialisation exploration for the nano-formulation preparation platform.

Summer intern recruitment progressed in an orderly manner. Five interns, including Jiang Chuzheng, Wang Yiya, and Kang Rui; from institutions including the University of Cambridge, Imperial College London, University College London, and the University of Hong Kong; are due to join successively in July 2026. They will assist with experiments relating to liposome and LNP preparation processes and the exosome-separation platform.

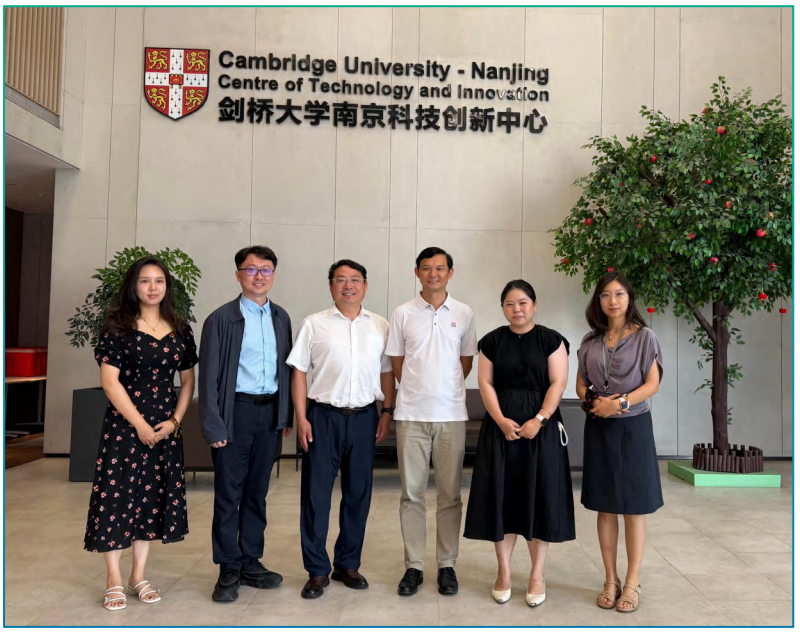

02 Fuel Industrial Momentum

The Centre deepened precise engagement on the industrial side, organised dedicated commercialisation exchanges and multiple enterprise visits, connected the collaboration chain between supply and demand, promoted the practical translation of original technological outcomes, and steadily demonstrated the effectiveness of industrial empowerment.

Deepening Engagement with Industrial Resources

Drawing on its full-chain innovation system that is **"Research-Innovation-Development-Commercialisation"**, the Centre provides end-to-end commercialisation services for universities and research institutes, innovative enterprises, and investment institutions. These services cover technology-commercialisation assessment, industrial-fund matching, collaborative R&D co-development, and the implementation and translation of outcomes. The Centre regularly organises dedicated engagement and exchange sessions around themes such as commercialisation-pathway design for research projects, industrial-capital preparation, and joint enterprise technology development, supporting efficient cooperation among industry, academia, research, and capital.

The Centre's industry-engagement team can provide customised and professional matching support in response to needs such as collaborative technology development, industrial-ecosystem co-building, and outcome translation. This includes project business planning, partner matching, policy-resource introduction, plus investment and financing engagement.

Accelerating the Implementation of Industrial Outcomes

The laboratory area on the seventh floor of the Centre centrally presents incubated enterprises derived from original technologies, cases of intellectual-property licensing and transfer, and typical application-validation outcomes. Through systematic display of core technologies, product forms, application scenarios, and commercialisation pathways, it comprehensively demonstrates the Centre's overall strength in original-technology R&D, project incubation, and industrial implementation, providing direct support for visits, exchanges, and industrial engagement.

Rapid Growth of Cambridge Alumni Enterprises Incubated by the Centre

The Centre has maintained close contact and interaction with Cambridge alumni, actively attracting high-quality alumni projects to establish physical operations in Jiangbei New Area. With the support of Jiangbei New Area Science City, the Centre has successfully promoted the landing and incubation of six key alumni enterprises, which have achieved rapid growth. Among them.

reavis

ReaVis Technology Co., Ltd. has completed financing of over RMB 100 million, backed by several professional investment institutions.

EPIC Efficient Power for Intelligent Computing

Nanjing EPIC Power Technology Co., Ltd. has also completed financing at a similar value and has recently received a substantial acquisition intention from an industrial party, with the overall valuation of the company reaching several hundred million yuan.

Fuheng Technology (Nanjing) Co., Ltd., drawing on its core strengths in building energy management, that will carry out industrial collaboration with the Centre to jointly advance the translation and scenario-based implementation of green and low-carbon energy-management technologies.

03 Advance Brand Events and Programmes

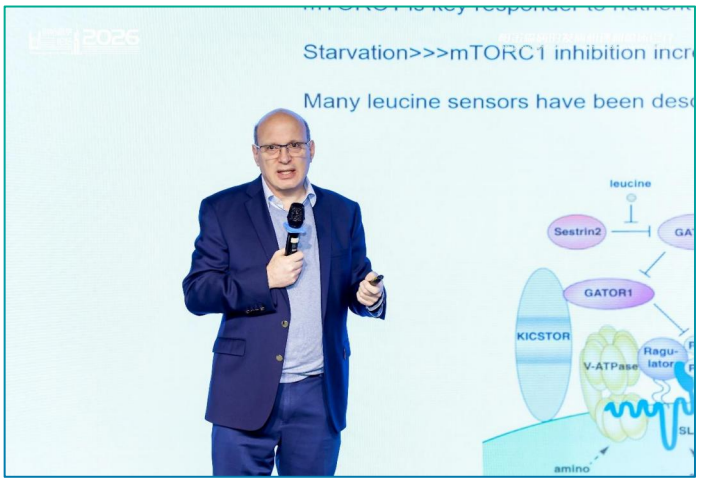

The Centre focused on building high-level international exchange platforms and coordinated a series of flagship-branded activities, including academic forums, admissions briefings, summer school programmes, and science popularisation. By fully connecting with Cambridge's high-quality science and education resources, the Centre empowered talent cultivation and public access to science and technology, while its brand influence continued to grow.

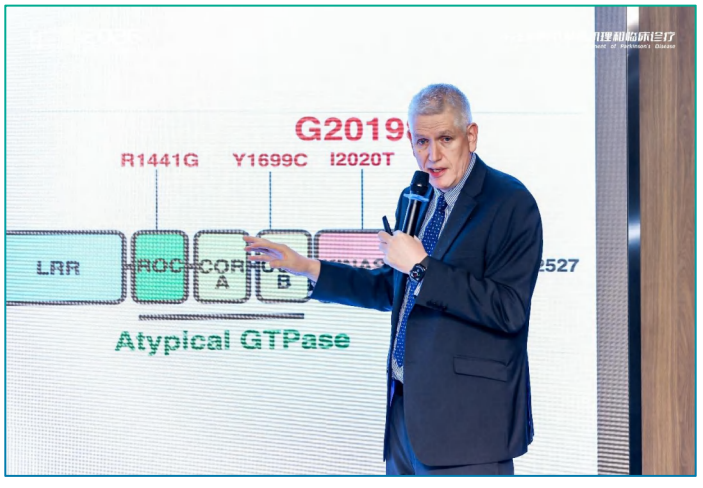

Successful Hosting of “Cambridge Nanjing Forum 2026 – Pathogenesis and Clinical Treatment of Parkinson's Disease”

On 27 March, the “Cambridge Nanjing Forum 2026 - Pathogenesis and Clinical Treatment of Parkinson's Disease” was successfully held. Hosted by the Centre and co-organised by Nanjing Brain Hospital, the forum aimed to accelerate the translation of basic research into clinical applications. Combining academic discussions and site visit, it brought together cutting-edge academic exchanges and exploration of clinical practice. Leading Chinese and British experts from the University of Cambridge, the University of Dundee, Nanjing Brain Hospital, General Hospital of Eastern Theater Command, Tianjin Medical University General Hospital, Nanjing Medical University, as well as Union Hospital, Tongji Medical College, Huazhong University of Science and Technology shared the latest advances in key scientific research and cutting-edge technological practices in the field of Parkinson's disease.

The event was attended by more than 70 guests on-site and nearly 800 participants online.

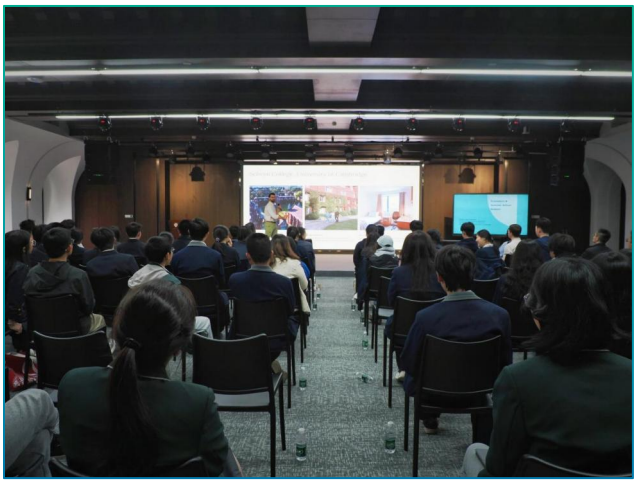

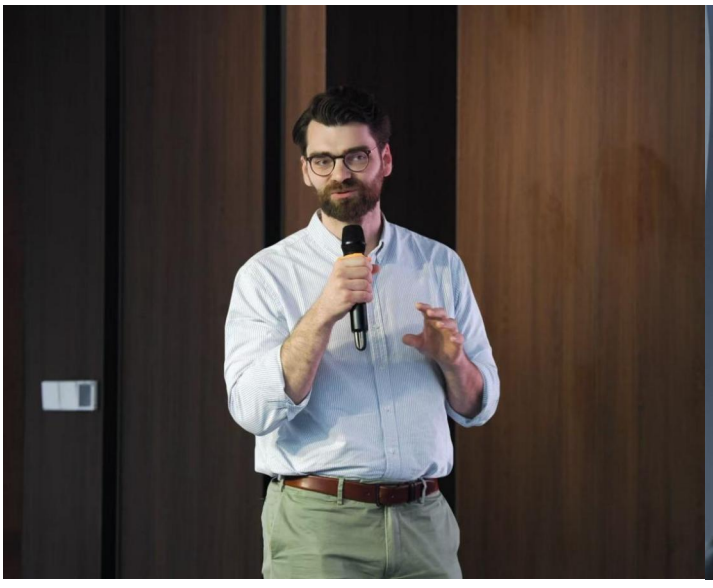

Renewed Success of "Applying to Cambridge: Undergraduate Study at Cambridge 2027"

On 16 April, **"Applying to Cambridge: Undergraduate Study at Cambridge 2027"** was successfully held at the Centre. The event created a direct official communication platform between outstanding Chinese students and the University of Cambridge. It delivered authoritative information on undergraduate admissions policies and provided targeted analysis of core application essentials.

This event attracted more than 80 students from key senior high schools and international schools across the Yangtze River Delta to participate on-site, while over 800 audience members from Beijing, Qingdao and other regions tuned in via live streaming. All participants gained direct access to first-hand information on Cambridge's undergraduate admissions.

Advance Brand Events and Programmes

Official Launch of the Cambridge Summer School Programme Series

Focusing on the development of international talent-training programmes, the Centre continued to advance the roll-out of Cambridge summer school programmes and launched a series of Cambridge summer programmes for university and secondary school students. Upon release, the programmes attracted widespread attention among students, with encouraging sign-ups and steady progress in admissions. These will be delivere at the University of Cambridge between July and August 2026. Through academic courses, research projects, social practice, cultural exchange, and campus visits, the programmes will provide young students with immersive international learning experiences, thereby further expanding the Centre's practical exploration in international talent training.

Steady Progress of the "CUNJC Popular Science"

The Centre officially launched the "CUNJC Popular Science" series of videos. Leveraging world-class research resources, the series aims to promote the public dissemination of cutting-edge scientific discoveries and broaden public access to fundamental research achievements. The first video in the Life and Health series has been released, featuring David Rubinsztein, Fellow of the Academy of Medical Sciences, Fellow of the Royal Society, Professor of Molecular Neurogenetics at the University of Cambridge, and UK Dementia Research Institute Group Leader, who took part in the popular science interview to share the latest advances in clinical treatment of Parkinson's disease.

04 Build Collaborative Innovation Ecosystem

The Centre steadily expanded domestic and international cooperation resources, deepened exchanges and mutual visits with research teams from the University of Cambridge, as well as domestic universities and research institutes, broadened its university-collaboration network, strengthened government-enterprise coordination, achieved further breakthroughs in platform qualification development, and continued to improve a diversified and integrated innovation ecosystem.

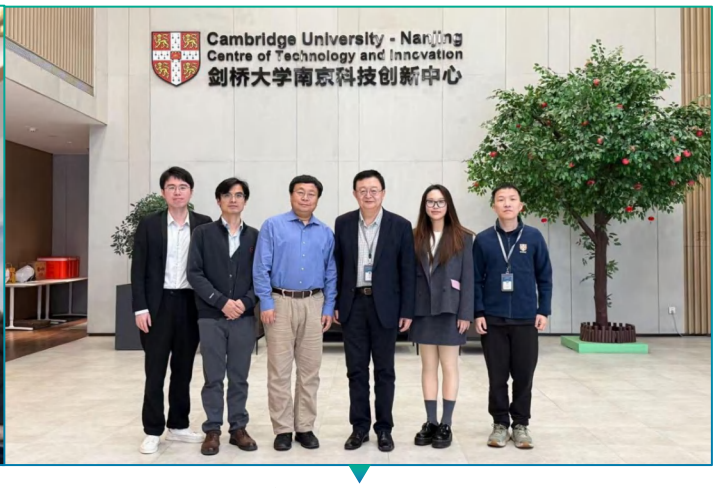

Deepening International and Domestic Exchange

• Deepening Mutual Visits and Exchanges with Domestic Universities and Research Institutions

The Centre maintained close engagement with a number of domestic universities and research institutions.

The Centre maintained close engagement with a number of domestic universities and research institutions. It conducted two-way visits with the Oxford Suzhou Centre for Advanced Research to exchange views on sustainable localised-development pathways for top international research resources.

The Centre hosted a team of experts in clean energy and carbon neutrality from Tsinghua University for in-depth discussion on industrial translation.

The Centre maintained two-way exchanges with the Jiangsu Provincial Centre for Biomedical Basic Research at Soochow University, with both sides continuing discussions on collaborative innovation in biomedicine.

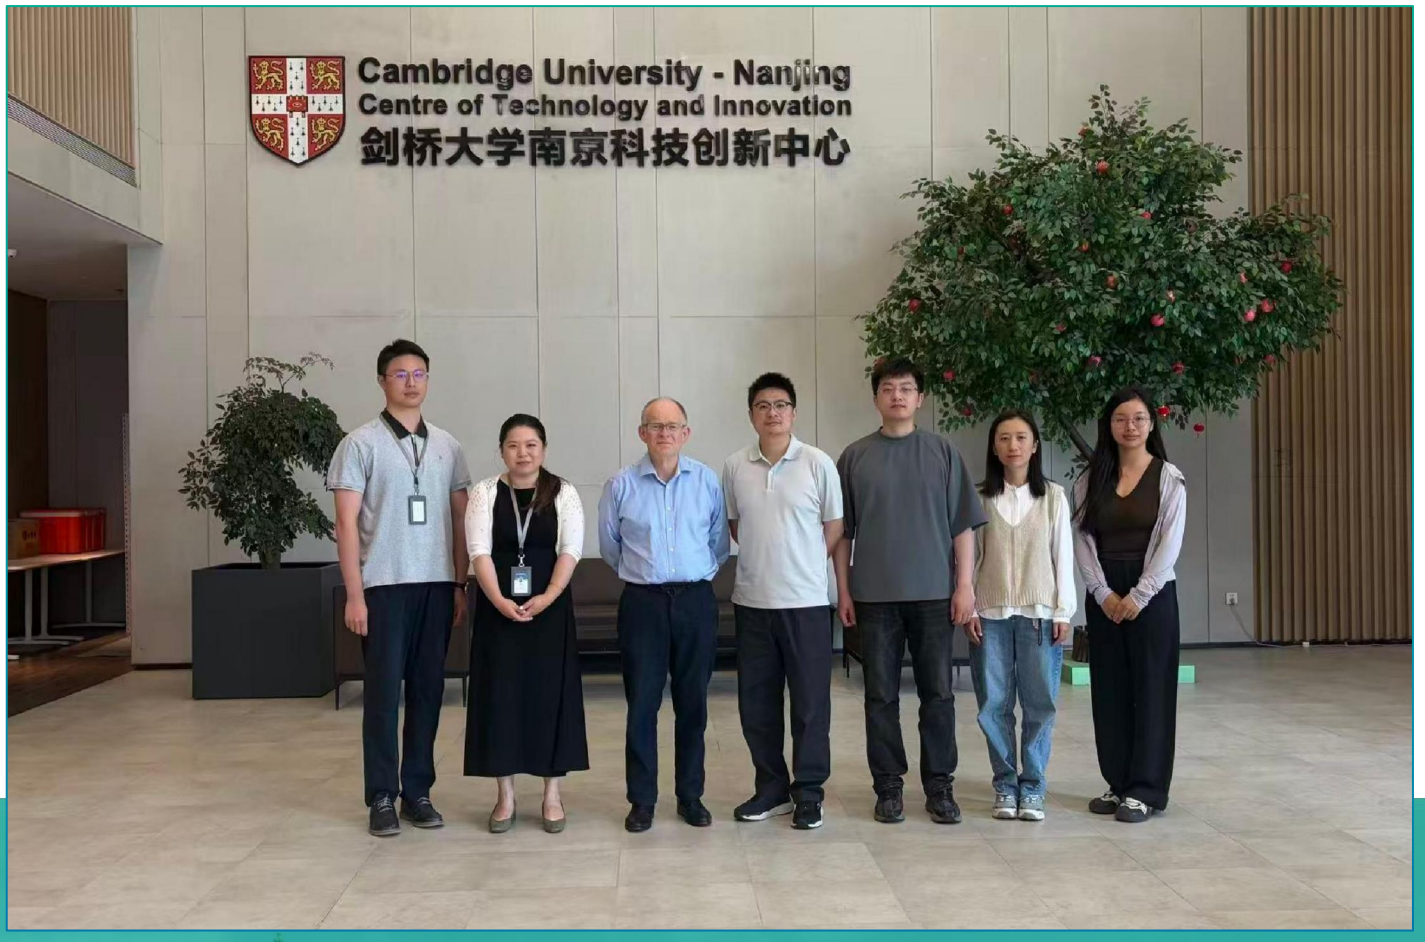

The Centre organised the operations team to visit the Yangtze River Delta Physics Research Centre for business engagement.

Build Collaborative Innovation Ecosystem

• Visits to the Centre by University of Cambridge Professors and Research Teams

Several professors and research teams from the University of Cambridge successively held discussions with the Centre's operations team and local project partners, enhancing mutual understanding and advancing preliminary engagement for relevant projects in parallel, thereby preparing for subsequent project implementation. Visitors included Fellow Dario Alessi, Fellow Richard Penty, Professor Lili Jia, Associate Professor Qixiang Cheng, and Dr Alex Samoshkin, among others.

Expansion of the University Collaboration Network

Centred on international-talent cultivation and collaboration mechanisms, the Centre carried out multi-dimensional and practical engagement with a number of universities, covering admissions briefings, academic lectures, and university-level discussions. The cooperation has extended from early-stage needs matching to substantive areas including joint-curriculum development and joint-talent cultivation.

The Centre especially invited Oleg Kitov, Associate Professor in the Department of Economics and Director of Undergraduate Admissions at the University of Cambridge, to China for a series of exchange activities. He was accompanied on visits to leading comprehensive universities including Fudan University, Nanjing University, and Southeast University, as well as key finance and economic universities including the Central University of Finance and Economics, Shanghai University of Finance and Economics, and Zhongnan University of Economics and Law. During these visits, he shared valuable insights with current students, focusing on postgraduate application planning, academic development pathways at Cambridge, and models for cultivating international-oriented talent. He also promoted the CUNJC Cambridge summer programmes and Cambridge academic exchange resources.

At the same time, the Centre held in-depth discussions with faculty and management teams of universities. Through academic reports, thematic seminars, and other formats, it explored topics including short-term academic-exchange programmes during winter and summer breaks, joint cultivation of innovation and entrepreneurship talent, and the introduction and localisation of Cambridge academic resources, promoting cooperation intentions towards long-term and institutionalised implementation.

Professor Kitov's exchange visit to Fudan University

Professor Kitov's exchange visit to Xiamen University

The Centre is currently expanding the network of university collaboration. For cooperation matters, please contact Wu Zeyu, Head of Cooperation Development

Government-Enterprise Coordination Empowering Scientific and Technological Innovation

• Continuously Deepening Government-resource Engagement and Jointly Planning the Centre's Development Pathway

The Centre deepened government-enterprise engagement and jointly planned future development. Governments and science and technology authorities at provincial and municipal levels have paid close attention to the Centre's platform development, helping to enhance the Centre's platform level.

On 11 February, Jiangbei New Area, the University of Cambridge, and the Centre held a high-level tripartite meeting. Sir Mark Welland, Vice-Chancellor of the University of Cambridge and Special Advisor for China Affairs, and Professor Daping CHU, Academic Director and CEO of the Centre, attended the meeting.

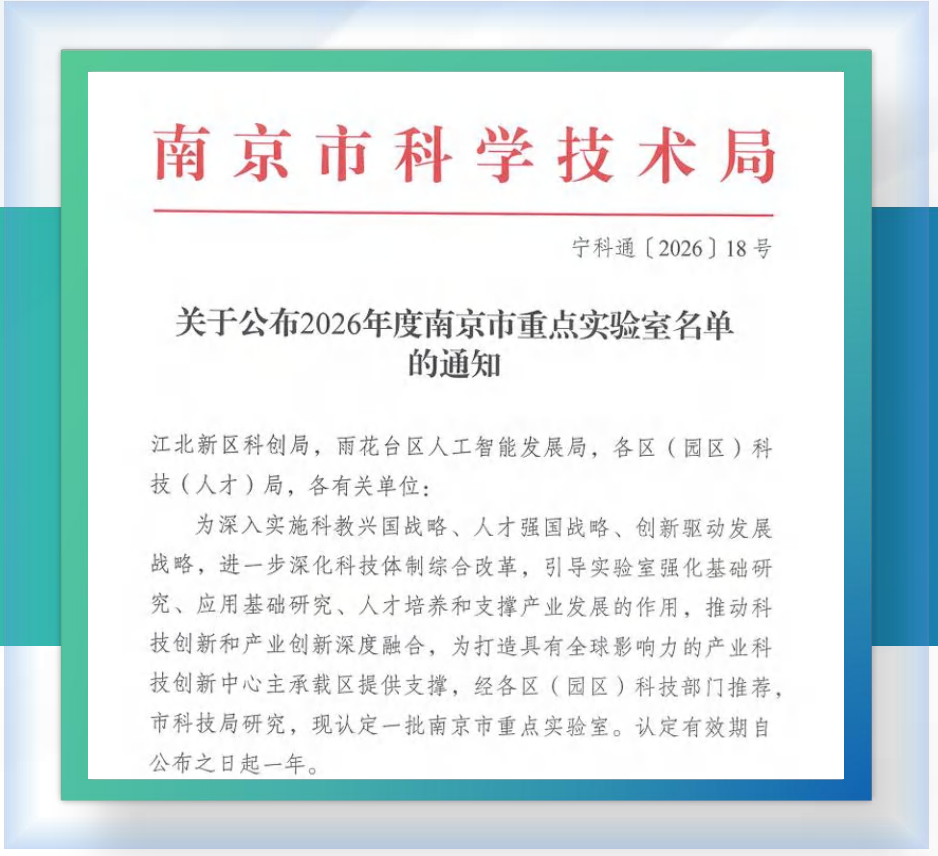

• Professor Daping CHU Attended the 14th China-UK Political Parties Dialogue and China-UK Entrepreneurs Roundtable

On 26 May, Professor Daping CHU, Academic Director and CEO of the Centre, attended the 14th China-UK Political Parties Dialogue and delivered a keynote speech at the China-UK Entrepreneurs Roundtable held under the framework of the Dialogue.

Expanding Portfolio of Qualifications and Honours

• The Centre was Recognised as a Nanjing Key Laboratory for 2026

南京市科学技术局

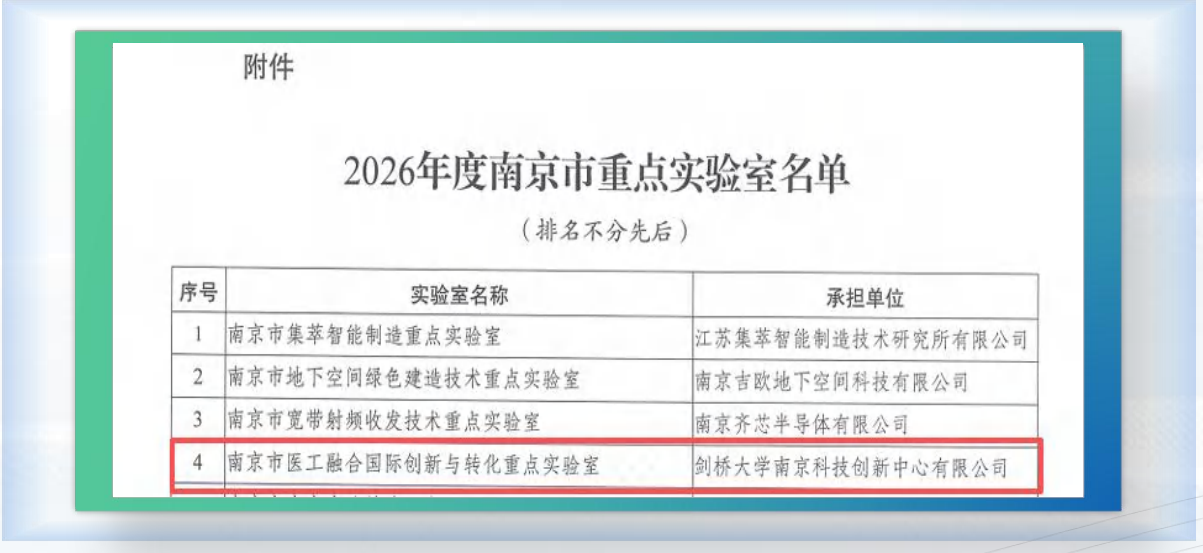

宁科通〔2026〕18号

关于公布2026年度南京市重点实验室名单的通知

江北新区科创局，雨花台区人工智能发展局，各区（园区）科技（人才）局，各有关单位：

为深入实施科教兴国战略、人才强国战略、创新驱动发展战略，进一步深化科技体制综合改革，引导实验室强化基础研究、应用基础研究、人才培养和支撑产业发展的作用，推动科技创新和产业创新深度融合，为打造具有全球影响力的产业科技创新中心主承载区提供支撑，经各区（园区）科技部门推荐，市科技局研究，现认定一批南京市重点实验室。认定有效期自公布之日起一年。

On 19 May, the Nanjing Municipal Bureau of Science and Technology issued the Notice on announcing the List of Nanjing Key Laboratories for 2026 (Ning Ke Tong [2026] No. 18), according to which the Centre's Nanjing Key Laboratory for International Innovation and Translation in Medical-Engineering Integration was approved and recognised.
